

Workflow Automation - Case Study

Pick a real workflow - one you've experienced or observed - that is repetitive, data-heavy, and still done manually by humans. It could be from any domain: education, healthcare, finance, operations, content creation, customer support, government services, anything.

Your challenge: build an AI agent that handles 80% of that workflow autonomously, while knowing when to escalate to a human.

The Brief:

You choose the problem. We evaluate how you think.

Your agent must:

- **Solve a real workflow problem** - not a toy example. The problem should be something real people waste real time on.
- **Be agentic** - it should make decisions, take actions, handle branching logic, and know when to escalate. Not just "summarize this text."
- **Have a clear user** - who uses this, when, and how? Design for that person.
- **Handle failure gracefully** - what happens when the input is messy, ambiguous, or outside scope?
- **Be deployed and accessible** - via link, bot, CLI, or whatever makes sense for the user.

Example Problems (Pick One or Bring Your Own)

- **RFP Scanner:** An agent that monitors donor/grant websites, classifies opportunities by relevance to an org's profile, and generates a daily digest with fit scores and deadlines.
- **Meeting-to-Action Pipeline:** Takes a meeting transcript (messy, with crosstalk) and extracts decisions, action items with owners, and unresolved questions - formatted for Slack and email.
- **Document QA Agent:** Takes a long policy document or report and lets a user ask questions in natural language, with cited answers pointing to specific sections.
- **Intake Triage Bot:** For a helpdesk, clinic, or service center - takes an incoming request, classifies urgency, gathers required info via conversation, and routes to the right person with full context.
- **Content Localization Agent:** Takes English content and produces culturally adapted versions for a specific market (not just translation - tone, references, examples all adapted).

How to Submit

- **Link to your working agent** - deployed and testable.
- **A short write-up (max 1 page)** covering:
 - Why this problem? What made you pick it? How did you discover it was worth solving?
 - Who is the user?

- Architecture: how does the agent work? What decisions does it make autonomously?
What does it escalate?
- What did you learn?

Application Deadline is 3rd June 2026.

Good Luck!
